What Is Merkel Cell Carcinoma?

- Merkel cell carcinoma
- Other types of skin cancer

Merkel cells

Merkel cells are thought to be a type of skin **neuroendocrine cell**, because they share some features with nerve cells and hormone-making cells. Merkel cells are found mainly at the base of the top layer of the skin (the epidermis). These cells are very close to nerve endings in the skin. They help us sense light touch, which lets us do things like feel the fine details on an object's surface.

Merkel cells were first described in the late 1800s by a German doctor named Friedrich Merkel.

What Is Cancer? 1

Cancer starts when cells in the body begin to grow out of control. Cells in nearly any part of the body can become cancer cells. Learn more here.

Merkel cell carcinoma

Because Merkel cells are a type of neuroendocrine cell, Merkel cell carcinoma (MCC) is also sometimes called **neuroendocrine carcinoma of the skin.** Another name for MCC is trabecular carcinoma (or trabecular cancer).

MCC is much less common than most other types of skin cancer (see below), but it's one of the most dangerous types. (The other dangerous skin cancer is melanoma.) It's much more likely than common skin cancers (squamous and basal cell skin cancers) to spread to other parts of the body, and it can be very hard to treat if it has spread.

These cancers most often start on skin that's exposed to the sun, like the face (the most common site), neck, and arms. But MCC can start anywhere on the body. Merkel cell tumors often look like firm, pink, red, or purple lumps or bumps on the skin. They usually don't hurt, but they're fast-growing and can sometimes open up as ulcers or sores (see Signs and Symptoms of Merkel Cell Carcinoma³).

Nearly all MCCs start on the skin, but a very small portion start in other parts of the body, such as inside the nose or esophagus.

Other types of skin cancer

There are other, more common skin cancers. For more on these types of cancers, see Basal and Squamous Cell Skin Cancer⁴ and Melanoma Skin Cancer⁵.

Less common types of skin cancer

Other, much less common types of skin cancer include:

- Kaposi sarcoma⁶
- Lymphoma of the skin⁷
- Skin adnexal tumors (tumors that start in the hair follicles or skin glands)
- Various types of <u>sarcomas</u>⁸
